

LDMS USER GROUP MEETING

April 20, 2026

Agenda

- LDMSCON2026 – deadlines
- LDMS Multi-Tenant Security Working Group
- V4.5.2
- Q&A

LDMSCON2026

LDMSCON2026 – Deadlines

<https://sites.google.com/view/ldmscon2026/home>

LDMSCON2026 — Deadlines Are Coming Up

LDMSCON2026 · June 9–11, 2026 · David Rubenstein Forum, University of Chicago

Submission deadline: May 1 ← 11 days away

Submit: <https://easychair.org/cfp/ldmscon2026>

Registration deadline: May 15 ← late pricing kicks in after this date

Register at: <https://ldmscon2026.eventbrite.com/>

LDMS Multi-Tenant Security Working Group — Update

Multi-Tenant Security WG — Status

Second Meeting:

When:

- This Friday, April 24 @ 12 - 1:30 PM CDT (Rescheduled from April 10)

Zoom Link:

- A calendar invite has been updated and sent to the group mailing list

NOTE: Kickoff meeting notes sent to the group mailing list on April 8.

Any trouble accessing the Google doc, please contact nichamon@ogc.us

V4.5.2

Sandia
National
Laboratories

OGC

V4.5.2 – Coming soon

Tag will be made after today's meeting.

Bug fixes in:

- YAML config parser
- LDMS transport
- Race condition in LDMS Messages
- Various sampler and storage plugin fixes
- Build fixes

Heads up: ldms_msg subscribers – message_channel attribute is renamed to message tag. (Backward compatibility model available)

More details at the next meeting

Q & A

OGC

Sandia
National
Laboratories

- V4.5.1's RDMA issue: <https://github.com/ovis-hpc/ldms/issues/2231>
 - We tested on a different omniopath machine and found that `rdma_connect()` returned -1 when `ldms_ls` connecting to `ldmsd`. With further investigation, the system is configured to use Datagram. `ldms`'s RDMA uses connection-oriented.
 - TODO: add commands to verify LLNL's system configuration if it's UD mode or not to the issue

Thank you!

Multi-Tenant Security WG — Security challenges identified

- **Identity verification across container/host boundary** — Idmsd on neither side can verify the other's identity; a compromised container could inject fabricated metrics and fake who they are
- **UID/GID namespace isolation breaks identity assertions** — container UIDs are assigned independently from host UIDs, so the same numeric ID refers to different principals across the boundary
- **LDMS lacks a sufficient access control mechanism for multi-tenant environments** — current Unix file permissions cannot express who among multiple groups can access which metrics, nor enforce those rules across container and host boundaries

Multi-Tenant Security WG —

Two approaches under investigation

- **Certificate-based authentication** — uses signed credentials to verify identity at connection time. Directly addresses identity verification across boundaries and the lack of portable credentials across domains
- **Unix domain socket transport** — uses the OS-level socket as the trust anchor, scoped to the local filesystem namespace. Addresses intra-node container-to-aggregator hops but does not extend to cloud environments
